Experience

Nanook Energy Advisors **July 2025 – Present**

Software Engineer | Python · Kubernetes · AWS

- Architected the greenfield cloud and data platform to power quantitative research and strategy development/deployment
- Co-developed an LLM agentic harness for orchestrated intelligence gathering, integrating tool execution, prompt A/B testing, and LLM cost/token tracking
- Productionised quantitative models and dashboards into robust Kubernetes workloads, establishing automated scheduling, monitoring, and self-service deployment templates with CI/CD
- Engineered distributed, parallel backtesting pipelines and frameworks leveraging Argo Workflows
- Provisioned and maintained all underlying infrastructure (including the EKS cluster, databases, and third-party services), integrating comprehensive MLOps and observability for operational resilience

Acorn Insurance **April 2023 – June 2025**

Software Engineer | Python(FastAPI) Microservices · Kubernetes · Azure

- Sole developer on the data science team and the main point of contact between other DevOps teams and data scientists
- Designed and built applications for critical real-time business operations, driving price optimisation and enabling predictive analytics for claims cost and intervention probabilities
- Aided the data scientists in the standardisation of ML pipelines, delivering reusable objects for rapid development and automated retraining, complemented by robust data preparation and pipelines
- Met all requirements with almost 100% availability and response times under SLA with good margins and scalability
- Maintained a key focus on observability (LGTM stack) during app development, ensuring app performance and stability, delivering said performance/stability metrics and insights to stakeholders for informed, confident decision-making
- Led the migration of data ingestion jobs to a real-time event-driven architecture

Mastercard **March 2022 – April 2023**

Software Engineer | Go / Python Microservices · Kubernetes · Azure

- Key actor in the deployment of an ML anti-fraud application scoring over 99.9% of UK bank transactions
- Provided real-time support to maintain downtime/service degradation within the requirements of our SLA
- Worked between the MLEs and data engineers to harmonise simultaneous development/deployments

KX - First Derivatives **October 2021 – March 2022**

Software Engineer, Capital Markets Graduate Programme | Kdb+ · Q

- Lone software engineer deployed to a Formula 1 race team tasked with the creation of a Race Ops application
- Co-authored data ingestion pipelines to meet strict requirements to ensure data was available to trackside engineers
- Co-delivered a Proof of Concept to the Renault Clio Cup, securing both a product sale and future contracted work
- Developed a strong self-taught foundation in Q/Kdb+, going beyond the standard grad course through personal projects including building tickerplants across TimescaleDB, Influx, and Prometheus

Education

Imperial College London **Graduated May 2021**

Bachelor of Engineering in Computer Engineering (EIE), Upper Second-Class Honours

Technical Skills

Languages Advanced: Python (NumPy, Pandas, FastAPI...)
Languages Intermediate: SQL, Kdb+/q
Languages Beginner: Go, C++, C#, R
DevOps and Infra: Kubernetes, Docker, Helm, Terraform, Azure Pipelines, Git, AWS Lambda, Argo Workflows
Data Storage/Processing: Postgres, Delta Lake, Mongo, Redis, Kafka, Azure Service Bus, Fivetran, Kdb+, TimescaleDB
Cloud: AWS, Azure, Google Cloud Platform, Firebase, Databricks
Observability: Prometheus, Grafana, Kibana, Loki, Tempo
